Active control is much more effective in controlling low and middle frequency range than traditional passive control. Active noise control has potential to reshape the noise in order to achieve better interior sound quality. Active control will lead to a lighter-weight, fuel efficient vehicles by avoiding bulky passive control applications. Active control systems of noise and vibrations The custom vibration isolation, high and low frequency curative solution. Since 1988, PAULSTRA has designed and developed active isolation systems. These systems are an extension of the PAUSTRA/VIBRACHOC range of product with high efficiency at low frequencies.

Active control systems of noise and vibrations

This book describes the fundamentals of active noise control and cancellation. It is getting quite old, but fundamental principles don't change, and in this department it is very strong. Moreover nothing of any significance has happened recently apart from a gradual displacement of noise cancellation from the research lab to consumer goods.

Active Control of Wind Noise Using Robust Feedback Control A feedback controller has been developed using robust control techniques to control the sound radiated from turbulent flow driven plates. The control design methodology uses frequency domain loop shaping techniques.

Active Control of Wind Noise Using Robust Feedback Control

To design an active noise controller, the transfer function between the reference signal and the error signal should be measured and defined. When the noise source operates at specific frequencies, the transfer function can only be measured at the operating frequency and its harmonics.

By identifying the average noise level of the ambient environment from dynamic microphone and together with the activity recognition data obtained from the inertial sensors, the automatic volume control is achieved. Experiments are conducted with five different mobile devices at various noise-level environments and different user activity states.

Alternatively, active noise control (ANC), which introduces an out-of-phase secondary acoustic wave form to cancel the sound source response, is a more effective approach for controlling low frequency noise and might allow for a reduction in the weight of headsets. This is desirable for patient's comfort, particularly during long scans.
