Parametric Design for Architecture

This course is targeted at architects, designers and students who know 3D modelling, but want to develop parametric design models. During a series of video tutorials, we start with a few basic examples and gradually develop more advanced topics. You will create freeform roof shapes with automatic panelling.

This investigation by Jan Harmens will analyse and define the definition for Parametricism. It will analyse and compare multiple parametric theories. Then using case studies to endeavour how parametricism has been used in the design process. From this research definition of Parametricism will be assessed to discover whether what is being claimed as parametric architecture is actually parametric not not.

Parametric Architecture | Parametric House

Parametric design is a design process that sets up the structural geometry of a project through parametric modeling techniques. This helps determine both structural form and members. It then proposes various options in structural form so the structural design options can be iterated to architects and clients.

Parametric Design in the 21st Century - ThoughtCo

Parametric design is a paradigm in design where the relationship between elements is used to manipulate and inform the design of complex geometries and structures. The term parametric originates from mathematics and refers to the use of certain parameters or variables that can be edited to manipulate or alter the end result of an equation or system. While today the term is used in reference to computational design systems, there are precedents for these modern systems in the works of architects

“Parametric House has been a great resource for my design team. We are pivoting toward incorporating more parametric driven designs and this coursework is the foundation of that effort. We chose 17 courses with varying levels of difficulty and skills and created a learning package that each team member must watch and recreate.
