The aim of this study was to evaluate the diagnostic performance of direct wet mount microscopy compared to formalin ether concentration (FEC) technique in detecting intestinal helminths in pregnant women. The total prevalence of intestinal helminths was 18.8% (70/372) by direct wet mount microscopy and 24.7% (92/372) by FEC technique ($P < 0.001$).

A high performance Soft-Decision FEC (i.e. >1Gbps), is a major building block used to enable these systems to function under non-ideal environments. The Soft-Decision Forward Error Correction (SD-FEC) integrated block supports Low Density Parity Check (LDPC) decoding and encoding and Turbo code decoding.

And with its higher optical performance it can still support useful reaches with weaker FEC algorithms. One aspect of a system's design that is often overlooked is matching the type of FEC on both ends of a link. If the host at one end supports one type, the other end had better support the same type. Otherwise, the link will not work properly.

FEC information is usually added to mass storage (magnetic, optical and solid state/flash based) devices to enable recovery of corrupted data, is widely used in modems, is used on systems where the primary memory is ECC memory and in broadcast situations, where the receiver does not have capabilities to request re-transmission or doing so would ...

In communication systems, information theory, and coding theory, forward error correction (FEC) is a technique used for controlling errors in data transmission over unreliable or noisy communication channels. FEC owes its beginnings to the pioneering work of Claude Shannon in 1948 on reliable communication over noisy transmission channels.

FEC dramatically lowers the BER and extends the distances that optical signals can be transmitted without regeneration. There are a number of FEC algorithms to choose from that vary in complexity, strength, and performance. One of the most common and standardized first-generation FECs, is

For Ethernet applications, the frame loss ratio (FLR) is normally used as the post FEC system performance metric: where MFC is the number of MAC frames per codeword, say $MFC = 8$. FLR to post-FEC BER ratio is roughly 620. In this section, we focus on the analysis of KP4 FEC, RS (544, 514, 15) over GF (2 10).

Another approach to improving the TCP performance is to enhance the lower layer protocol, i.e., the data link layer protocol, by incorporating, e.g., ARQ (automatic repeat request) and/or FEC (forward error correction) [4]. FEC is a simplest solution to improve the bit error ratio seen by the higher layer protocol.
