Single Sampling And Double Sampling

In double sampling, $(r_2 = a_2 + 1)$ to ensure a decision on the sample. If $(D_2 \leq a_2)$, the lot is accepted. If $(D_2 \geq r_2)$, the lot is rejected. 6.2.4. What is Double Sampling?

There are a number of sampling schemes known as sampling plans. Their choice depends upon the nature of the manufacturing system and the degree of consumer and producer risks which one wants to cover. The sampling schemes are: (i) Single sampling plan (ii) Double sampling plan

LQAS methodology under single/double, multiple sampling plans are provided separately for Poisson distribution with/without considering the Power are developed. Pragmatic solutions for the sample size and the corresponding acceptable number 'd' are obtained for different sampling plans such as single, double and multiple sampling plans.

(v) A double sampling plan involves more overheads than a single sampling plan. (vi) It involves more record keeping than a single sampling plan. 3. Multiple Sampling Plans: A lot is accepted or rejected based upon the results obtained from several samples (of parts) drawn from the lot. i.

Classification of Sampling Plans | Industries

In variables sampling, there are single, double, and sequential sampling plans that measure continuous data, such as time, volume, and length. The most commonly used form of acceptance sampling is sampling plans by attributes.

Attribute Sampling Plans - Inspection by Variables ...

Single sampling plans: One sample of items is selected at random from a lot and the disposition of the lot is determined from the resulting information. These plans are usually denoted as (n, c) plans for a sample size n , where the lot is rejected if there are more than c defectives.

It means, while the double sampling plan is as effective as the single sampling plan, the former is less expensive to conduct. From a psychological viewpoint, it is desirable to have a second chance. Sometimes using a double sampling plan is the only way of chance.

classified as single sampling, double sampling, multiple sampling and sequential sampling. In the attribute case, a single sampling plan requires a single sample to be taken from the lot. The lot will be accepted if the number of nonconforming units found in the sample is less than or equal to a pre-specified acceptance level, otherwise, it will be rejected. Double sampling will

The Double Sampling Plan consists of two sets of Acceptance Numbers, Rejection Numbers and Sample Sizes. Normal inspection is used until such time as the results of inspection dictate the Tightened or Reduced inspection should be employed as outlined in Switching Procedures on page 10.

INFO - AQL Inspector's Rule

A double-sampling plan can significantly reduce the costs of inspection relative to a single-sampling plan for lots with a very low or very high proportion defective because a decision can be made after taking the first sample. However, if the decision requires two samples, the sampling costs can be greater than those for the single-sampling plan.

G CCEPTANCE SAMPLING PLANS

The Acceptance Number (c) is the maximum number of non-conformances allowed within the sample. You'll also see a rejection number (r), which for single sampling plans, is always one non-conformance more than the acceptance number (c). For double and multiple sample plans this rejection number will vary.

Acceptance Sampling for the Certified Quality Engineer

He is universally known for his work in originating acceptance sampling plans for putting inspection operations on a scientific basis in terms of controllable risks. Harry G. Romig is the author of Sampling Inspection Tables: Single and Double Sampling, 2nd Revised and Expanded Edition, published by Wiley.

Plans requiring only a single sample set are known as single sampling plans; double and multiple sampling plans may require additional samples sets. For example, an attribute single sampling plan

Choice of n and n' Write $\hat{R} = \frac{1}{n} \sum_{i=1}^n Y_i$ where Y_i and Y'_i contain all the terms containing n and n' respectively. The cost function is $Cn + C'n'$ where C and C' are the costs per unit for selecting the samples n and n' respectively. Now we find the optimum sample sizes n and n' for fixed cost C_0 .
